

# Herleitung der Fresnelgleichungen

<http://physics.gmu.edu>

**TE-Fall:**  $\mathbf{E}$  ist parallel zur Grenzfläche

Tangentialkomponente von  $\mathbf{E}$  stetig:

$$E_e + E_r - E_g = 0$$

Tangentialkomponente von  $\mathbf{B}$  stetig:

$$-B_e \cos \alpha_e + B_r \cos \alpha_r + B_g \cos \alpha_g = 0$$

Drücke  $\mathbf{B}$  durch  $\mathbf{E}$  aus:

$$B = E / c = nE / c_0$$

Reflexionsgesetz:

$$\alpha_e = \alpha_r$$

Daraus folgt für B:

$$-B_e \cos \alpha_e + B_r \cos \alpha_r + B_g \cos \alpha_g = 0$$

Refl. Gesetz

$$\Rightarrow (B_r - B_e) \cos \alpha_e + B_g \cos \alpha_g = 0$$

$B \leftrightarrow E$

$$\Rightarrow n_1(E_r - E_e) \cos \alpha_e + n_2 E_g \cos \alpha_g = 0$$

Stetigkeit  $E$

$$\Rightarrow n_1(E_r - E_e) \cos \alpha_e + n_2(E_e + E_r) \cos \alpha_g = 0$$

Ausklammern:

$$\Rightarrow E_r(n_1 \cos \alpha_e + n_2 \cos \alpha_g) + E_e(n_2 \cos \alpha_g - n_1 \cos \alpha_e) = 0$$

Reflexionskoeffizient für TE-Fall:

$$\Rightarrow \frac{E_r}{E_e} = \frac{(n_1 \cos \alpha_e - n_2 \cos \alpha_g)}{(n_1 \cos \alpha_e + n_2 \cos \alpha_g)}$$

Brechungsgesetz:

$$n_1 \sin \alpha_e = n_2 \sin \alpha_g$$

$$\Rightarrow \frac{E_r}{E_e} = \frac{(n_1 \cos \alpha_e - n_2 \sqrt{1 - \sin^2 \alpha_g})}{(n_1 \cos \alpha_e + n_2 \sqrt{1 - \sin^2 \alpha_g})} = \frac{(n_1 \cos \alpha_e - \sqrt{n_2^2 - n_1^2 \sin^2 \alpha_e})}{(n_1 \cos \alpha_e + \sqrt{n_2^2 - n_1^2 \sin^2 \alpha_e})}$$
